Linux section 8 - creation of file

- Touch command is use to create an empty file.

-

- CP command will be used when you are copying and existing file and creating a new one at the destination location.

> **CP <existing file name> <new file name>**

- Vi command is used as editor and also creating a file at same time.

- Mkdir is used to create the directory.

- To list all the files on the reverse time order use the command ls- ltr

Copying directory:

When we copy a file cp command is used.

When it comes to directory then using just cp will give an error coz directory has so many files within it.

So we will use copy command with a flag -R this means in recurring manner copy all the files inside the directory to the target location.
